Curriculum Vitae – Short Biography

Dr. Marc R. Dusseiller

Citizen of Switzerland, born on 4.11.1975

Dr. Marc R. Dusseiller is a transdisciplinary scholar, lecturer for micro- and nanotechnology, cultural facilitator and artist. He works in an integral way to combine science, art and education. He performs DIY (do-it-yourself) workshops in lo-fi electronics and synths, hardware hacking for citizen science and DIY microscopy. He was co-organizing Dock18, Room for Mediicultures, diy* festival (Zürich, Switzerland), KIBLIX 2011 (Maribor, Slovenia), workshops for artists, schools and children as the former president (2008-12) of the Swiss Mechatronic Art Society, SGMK. In collaboration with Kapelica Gallery, he has started the BioTehna Lab in Ljubljana (2012 - 2013), an open platform for interdisciplinary and artistic research on life sciences. Currently, he is developing means to perform bio- and nanotechnology research and dissemination (Hackteria | Open Source Biological Art) in a DIY fashion in kitchens, ateliers and in developing countries. He was the co-organizer of the different editions of HackteriaLab 2010 - 2014 Zürich, Romainmotier, Bangalore and Yogyakarta.

Short Biography

'15 - now	Guest faculty researcher at the (Art)ScienceBLR, Srishti School for Art, Design and Technology , Bangalore, India
'12 - '13	Co-Initiator and scientific program director of BioTehna Lab , with Kapelica Gallery , Ljubljana, Slovenia
'09 - now	Co-founder of Hackteria Open Source Biological Art and Co-Organizer of HackteriaLabs 2010 - 2013, International Organization of festivals and workshops for the Swiss Mechatronic Art Society (SGMK) and Dock18 , Switzerland
'07 - now	Organization of festivals and workshops for the Swiss Mechatronic Art Society (SGMK) and Dock18 , Switzerland
'08 - now	Lecturer for traditional materials in sculpting and hands-on lab courses at ETH Zürich , Switzerland
'08 - '12	Lecturer for Micro- and Nanosystems for Life Sciences at FHNW , School for Life Sciences, Switzerland
'06	Doctor of Sciences "Micro- and Nanoengineering the 3D Environment of Cells in Culture" , ETH Zürich, Switzerland
'01	Diploma in Material Science and Engineering, ETH Zürich , Switzerland

Selected Work

'15	Collaboration on BioAutonomy Lab and development of DIY Gynecology tools , Hangar , Barcelona, Spain
'15	Facilitator of diploma projects on „ Extreme Places and Extended Senses “ at Srishti , Bangalore, India
'14	Organizer and active Mentor of PiksteriaLab 2014 – Bergen , as part of PIKSEL14 - be\O/art , Bergen, Norway
'14	Co-Organizer of Läb(e) am Egge in collaboration with Baggensbos & Rudolf and Corner College , Zürich, Switzerland
'14	Workshop „ DIY von Laborgeräten in der Bioanalytik “, in partnership with SATW , Muttenz, Switzerland
'14	Workshop with Andy Gracie Artistic Instruments for Submarine Exploration @ Arte y Ciencia en el Mar , Gijon, Spain
'14	Workshop with Dominik Mahnič Mestna jaga: Helsinki Rabbit Hunts , @ foodycle festival , Helsinki, Finland
'14	Initiator of RandeLab , an artist-in-residence program for forest, nature and eco-hacking, Mersihausen, Switzerland
'14	Co-organisation of #HSC lecture series , Hackteria Swiss Curriculum @ Corner College , Zürich, Switzerland
'14	Co-organisation of Hackteria: Biologische Kunst – Wissenschaft, Natur und Biohacking , Schaffhausen, Switzerland
'14	Co-director of HackteriaLab 2014 – Yogyakarta , and various workshops across Java , Indonesia
'13	NanoHacking workshop for high-school and art students, Biofilia , Aalto University, Helsinki, Finland
'13	Hackteria DIY-Biohacking: Agar is the Media @ CynetART Festival , Dresden Germany
'13	Hackteria BioHacking Lab at Share Cyberpunk Academy , REPUBLIKA Festival , Rijeka, Croatia
'13	Co-organization of pooloop Festival and Hackteria Field-trip , Starkart Gallery , Zürich, Switzerland
'13	Organization of MobileLabs Hackathon , BioTehna , Kapelica Gallery , Ljubljana, Slovenia
'13	Workshops and presentation during LabEasy with MadLab , Arts Catalyst , London, UK
'13	Co-organization of HackteriaLab 2013 – Bangalore , Bangalore, India
'13	Residency and workshops at Lifepatch - citizen initiative in art, science and technology , Yogyakarta, Indonesia
'12	Co-organization with Denisa Kera of Nomadic Science Lab during Mutamorphosis 2012 , Prague, Czech Republik
'12 - '13	Initiation, lab setup and various workshops at BioTehna Lab with Kapelica Gallery , Ljubljana, Slovenia
'12	Public art-and-science lab „ NanoŠmano – LifeSystems / ŽiviSistemi “, Kapelica Gallery , Ljubljana, Slovenia
'12	Hackerspace tour with Urs Gaudenz and workshops at Machine Project and BioCurious , California, USA
'12	Mentor at Sci-Art Nanolab , UCLA, CNSI and Art/Sci center , Los Angeles, USA
'12	Workshops and presentation at 1st Annual Hands-On Workshop in POC Diagnostics , Nairobi, Kenya
'12	Invited speaker at SHARE conference , Beograd, Serbia
'12	Workshop with Keith Lam „ X-Spirituual Sound Hacks “ at dimension+ lab , Hongkong, China
'11 - '12	Residencies at the Center for Everything , Bangalore, India and HONF , Yogyakarta, Indonesia
'11	Workshop and performance with ISRO and anyma for EXPERIMENTA! 2011 , Bangalore, India
'11	Co-curator of International Festival KIBLIX 2011 „Share is in the Air“ , Maribor, Slovenia
'11	Keynote presentation about Hackteria at the First UK DIYbio Summit , MadLab, Manchester, UK
'11	Co-organization of workshops „ Hackteria & SGMK BioCyberKidzz “, CYW, Ars Electronica 2011 , Linz, Austria
'11	Co-organization of HackteriaLab 2011 Romainmötier/Zürich , Switzerland
'11	Research based Exhibition „ NanoŠmano – Šmall Matter “, Kapelica Gallery , Ljubljana, Slovenia
'11	Hackteria workshops at Pixelache 2011 , (Finland), MechartLab , (Switzerland) and IMM hackerspace (Croatia)
'10	Research based Exhibition with Stefan Doepler : „ NanoŠmano “, Kapelica Gallery , Ljubljana, Slovenia
'10	Hackteria BioElectronix workshop and SGMK diy makeaway at ISEA2010 , Dortmund, Germany
'10	Workshop for Teachers DIY Microscopes , Technorama , Winterthur, Switzerland
'10	Workshop SlowGames , in collaboration with René Bauer, Bachelor in Game Design , ZHdK , Switzerland
'10	Organisation of the first Hackteria Lab , Dock18 , Zürich, Switzerland
'09 & '10	Playaround Workshop in collaboration with dimension+ and NTUA , Taipei, Taiwan
'09	Foundation of Hackteria Open Source Biological Art and Bio-Art workshops at Piksel09 , videotage and others
'09 & '10	DIY and Bio-Art Workshops during cellsbutton#03 , Gadjah Mada University , Yogyakarta, Indonesia
'09	Bio-Art Workshops at CEMA, Srishti School for Art, Design and Technology , Bangalore, India
'09 - '13	Co-organization and workshops for the pooloop Festival , '09, '11, '13, Zurich, Switzerland
'09	Collaboration on the installation Garage Astrobiology @ Interactivos?09 , Medialab Prado , Madrid, Spain
'08	Workshop at playaround (Taiwan) organized by microplayground , in collaboration with NCTU and ITRI , Taiwan
'08	Cooperation on interactive media sculpture “ The Electric Retina ” with Prof. Jill Scott, Zürich, Switzerland
'07 & '08	Coordinator of diy* festival , Zurich, Switzerland

Main Projects

Swiss Mechatronic Art Society

Schweizerische Gesellschaft für Mechatronische Kunst, SGMK (Reg. Society with seat in Zürich)

The Swiss Mechatronic Art Society (SGMK, established in 2006) is a collective of engineers, hackers, scientists and artists that joined to collaborate and promote on creative and critical uses of technology. They develop DIY technologies, collaborate with social and educational institutions, run the diy* festival and the public „MechArt Lab“ in Zurich, and organize workshops in electronics, robotics, physical computing, diy-biology, lofi-music. SGMK has been supported by Bundesamt für Kultur, Migros Kulturprozent, Stadt Zürich and more.

SGMK . Swiss Mechatronic Art Society <http://www.mechatronicart.ch>

Hackteria | Open Source Biological Art

(international network and webplatform, Reg. Society with seat in Zürich)

Hackteria is a webplatform and collection of Open Source Biological Art Projects instigated in February 2009 by Andy Gracie, Marc Dusseiller and Yashas Shetty, after collaboration during the Interactivos?09 Garage Science at Medialab Prado in Madrid. The aim of the project is to develop a rich wiki-based web resource for people interested in or developing projects that involve bioart, open source software/hardware, DIY biology, art/science collaborations and electronic experimentation. As a community platform hackteria tries to encourage the collaboration of scientists, hackers and artists to combine their expertise, write critical and theoretical reflections, share simple instructions to work with lifescience technologies, develop open source hardware for generic laboratory infrastructure and cooperate on the organization of workshops, temporary labs, hack-sprints and meetings. The hackteria project has been supported by: Sir Ratan Tata Trust, KulturRaum SH, Pro Helvetia, Migros Kulturprozent and more.

BioTehna | open platform for interdisciplinary and artistic research on life sciences, Ljubljana, Slovenia

BioTehna is an open platform for interdisciplinary and artistic research on life sciences and a series of public workshops, each mentored by expert/s in a specific scientific field. The BioTehna Lab is an open community bio-lab, where we ignite curiosity, experiment and explore interesting connections between nature and technology. Here, artists and scientists creatively combine living systems with innovative engineering solutions and in this way encourage reflection and awareness of the world in which we live in and how we think about the future. The initiative started as a collaboration of hackteria | Open Source Biological Art and Kapelica Gallery. The BioTehna platform has been supported through the KiiCS project by the European Commission / 7th Framework Programme and the Swiss Contribution to the enlarged European Union.

Research Plan

Introductory Remarks

During the last 8 years I have intentionally dedicated my personal research on practical „Real World“ topics outside of institutional and academic research institutions, exploring various new fields and working in a broad variety of cultural environments. Having an opportunity to deepen these research interests at Aalto University would give me the time urgently needed to synthesize and share my partially intrinsic knowledge into a more reflected form and focus on its value in a transdisciplinary educational framework. On the other hand I truly believe in the value of „amateur“ research, citizen science projects and the fertile innovative grounds present in the current rise of hackerspaces and more generally in informal learning environments of the DIY culture and grassroots organisations. Building bridges between the academic educationist discourses and the above mentioned auto-didactic self-learning environments could be one of the most enriching contributions of my role in the Department of Art Education. Thus I see my role less in establishing new research topics for myself, but introducing my already established practices into the academic environment, but on the other hand also deepen my knowledge of the theoretical research and discourses around transdisciplinary education at the art & science interface.

Mentoring and Teaching

I am very happy to contribute to the development of project ideas and mentoring of students with my broad background experience in material science and engineering, nano- and biotechnology and the more recent practical art-tech&sci education and biohacking strategies. I hope to involve some of the students in my main interests of research described below, as well as learning and researching into new topics as part of the collaborations with the doctoral students. During the last years most of my mentoring was only for short time projects, such as the wetPONG laboratory projects developed during my teachings at FHNW 2008 – 2012 or during 1-2 week workshops related to the hackteria framework, and I am very much looking forward for more intensive and longer term mentoring and collaborations with students on the masters and doctoral level.

Additionally I can offer to develop, organize and hold introductory classes on various topics of basic science, with an transdisciplinary approach dedicated for students from art, design, media and art education.

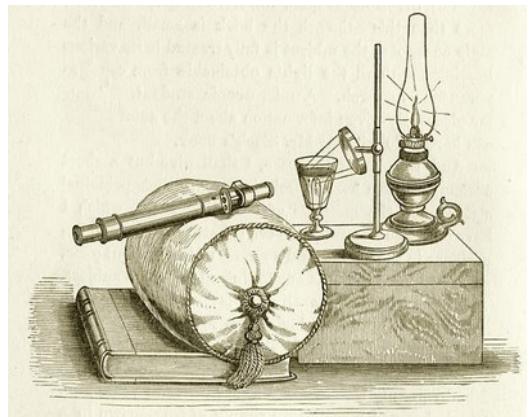

Crafting of Scientific Instruments for Personalized and Interdisciplinary Learning

„Science is popularly regarded as a “cognitive” activity – a discipline of the mind. But there is also a more physical and tactile tradition in science – a tradition in which scientists do not merely measure and theorize but also construct the instruments needed to do so. Indeed, many of the most important advances in scientific history were based on a combination of science, engineering, and design. Galileo’s construction of his own telescope (as described in Galilei, 1610), Boyle and Hooke’s design of the air-pump for experimentation with low pressure (Shapin, 1996), and Kelvin’s construction of a tide- measuring device (MacDonald, 1964) are examples of this tradition and staples of scientific lore. By building their own instruments – and understanding the capabilities and limitations of those instruments – scientists have historically gained deeper insights into the nature of the phenomena under investigation.“

- Mitchel Resnick, Lifelong Kindergarten, MIT

Since my early days as a young researcher and engineer I highly enjoyed working in the field of experimental sciences, designing and making experimental setups to test a scientific hypothesis or develop further existing early stage technologies. In fact, especially historically, it is a very common task of a scientist to design and construct their own instrumentation. For scientists, as pioneering explorers in the world of the unknown, there is and never will be a „mass produced“ product to do so. Only very recently, during the last two decades, a large industry has grown for scientific instrumentation as a consumer product, borrowing from design and marketing strategies from Apple’s iPhone or the car industry. As Resnick has put it nicely in his article „Beyond Black Boxes: Bringing Transparency and Aesthetics Back to Scientific Investigation“ [Resnick 2000].

Through my experience of working with artists interested in science over the last years and also communicating with a general public at various art/science events, I have experienced a deep misunderstanding and unawareness of that crafts tradition in science. Many artists are overwhelmed and inspired by the visual presence of the instrumentation itselfs and lack a more rational understanding of its inside workings, which sometimes

lead to an overmystification of the „machine“ instead of a critical and poetic interpretation about the content of the artist's interests in the sciences.

At the same time I have investigated and developed various instructions and workshop on making DIY laboratory instruments, most prominently my activities around the DIY microscope. Through these activities I have seen and explored the very promising educational value of that „make your own“ science instrument, both for artists working in the field, as well as in all other educational environments, from children in primary schools to undergraduate students in biomedical engineering. There is some fundamental learning experience in touching the materiality of the instrument, in crafting prototypes for scientific experimentation. And even if they might „fail“ in giving high-quality reproducible data suitable for academic publication, the more fundamental insight into the workings of the phenomena under observation and the sharpening of the students skill in critical thinking

The difference between the meaning of „understanding“ and „grasping“ is more nicely described in the German language, where „begreifen“ is involving a more deeper use of the mind and the body to interpret an object of interest and create a conception of the world around us, as Gerd Folkers describes in his article on „Der Sinn des Begreifens“:

„Fälschlicherweise werden „verstehen“ und „begreifen“ heute synonym verwendet. Zusätzlich zum Betrachten lege ich Hand an und begreife das Objekt im wahrsten Sinne des Worts. Diese zusätzlichen Informationen helfen dem Gehirn, viel tiefer in die Bedeutung des Objekts einzudringen und es so tatsächlich zu verstehen. Begreifen heißt demnach, Geist und Körper zu benutzen, um ein Objekt zu deuten. Und genau dies ist notwendig um uns als körperliche Wesen eine Vorstellung von der Welt, die uns umgibt, zu machen.“

- Gerd Folkers, Abstrakt, N°8 Machen ist Macht

I am now interested in developing further that environment for learning, as an interdisciplinary educational method, the crafting of scientific instruments, but not as a mere construction kit with predefined parts and instructions, but as a very open tool-kit that allows the poetic interpretation of such and personalizing the aesthetics of these instruments to enable a personal ownership of the projects by the students. We have already started this explorations with a focus on students training in the bioanalytical sciences, and I would like to broaden it to a more wider group of learners in the field of arts.

<http://hackteria.org/wiki/SATW-DIY>

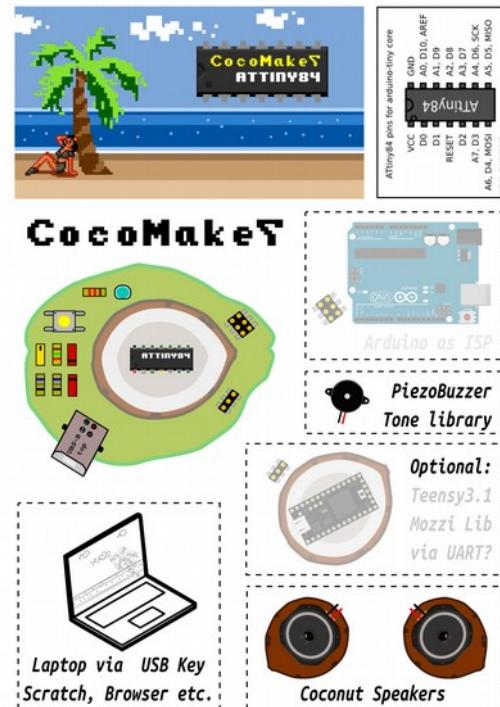

Digital and Interactive Hardware/Software Learning Tools for Low-Resource Settings

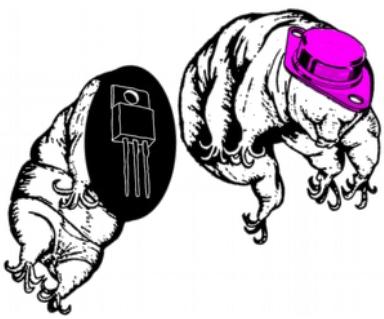

Through my activities in doing workshops in low-resource settings, eg. the Drisha School in Bangalore or various schools in Indonesia or Nepal, I have seen excellent educators using the most up-to date pedagogic concepts. It seemed to me that the free access and open source resources to educational materials, especially for teaching programming and digital storytelling, such as Scratch, can have a fundamental impact in digital literacy, both in industrialized nations, as well as in the global south. Similar platforms, developed by interdisciplinary teams of hackers, designers and educators, have now been developed to include dedicated hardware for physical computing, environmental sensing and digital interactivity, eg. the arduino platform, the smart citizen toolkit or the Makey Makey. But the price of these tools are still a limiting factor for their implementation (besides the general limit of access to computers). While in Europe a 30\$ hardware platform is considered „low-cost“, it can be a limiting factor in another environment and will not be implemented at all. We have initiated several projects with a team of international hardware developers, educators and designers to tackle that issue, such as the BabyGnusbuino, an arduino-compatible educational platform that can be locally produced for approximately 2€ or very recently the CocoMake7, which could replace a MakeyMakey for 1/10th of the cost of the original.

<http://hackteria.org/projects/cocomake7/>

<http://wiki.sgmk-ssam.ch/index.php/Babygnusbuino-v2>

I would be very interested to continue some of these approaches in collaboration with other departments at Aalto University, Media Factory, Electrical Engineering, as well as organizing international events outside of Finland, such hackathons and co-production labs, to enable temporary and immersive production and research environments in the „Real World“.

Hacking Biofilia

During many workshops and temporary labs, we have loved to say the following:

*„If you don't build your lab you don't own your lab.“
- unknown*

And when I was doing my workshop at Aalto, using the LUMA lab and biofilia, it was exactly what I was trying to create as an experience for the students. Instead of preparing the space for them before they arrive, I let them completely rearrange and setup the LUMA lab as a „Nano-hacking“ laboratory, unpack the materials and arrange the tools I brought and through this creating a more personalized learning environment, where THEY are in charge.

The biofilia laboratory is definitely a great opportunity to introduce artists and other people into the methodologies of modern biological science, having access to these environments seems sometimes very difficult for artists to achieve. And I can see even more opportunities and topics to use the biofilia environment for international courses, master classes, as well as using it for interdisciplinary training inside of Aalto University.

On the other hand I do think that only using this advanced laboratory space in art & sci education does also creates another boundary of non-access and does not really empower art students to continue their sparked interest in working with biological and living media further on in their practice. This has been one of the core approaches we have investigated and worked on during the last 6 years in the hackteria framework, setting up cheap and DIY laboratories for doing basic biology at home, in a kitchen, in an artist's studio or in a pop-up lab in a tropical jungle. So I would be very happy to complement the current activities in biofilia with a more hacker approach to practical science work and education. Also I am very interested to document, research and write more in-depth about „How to set up a biology lab in an art school“, consolidating the knowledge of our network into a usable document of recommendations, which can be adapted to a local context.

http://hackteria.org/wiki/NanoHacking:_Converging_Life_and_Tech_at_the_Nanoscale_-_Biofilia_HighSchool,_Finland

International Workshopology Symposium

The field of media arts has always been very interdisciplinary and many practitioners have a non-linear professional background, engineers bridging from computer science into sculpture or performance, landscape painters learning to program for digital interactivity. So to keep up with the fast developments in technology at many festivals and other events workshops are extremely important both as a learning environment for their own professional development, as well as a stable and regular income for the artist/hackers/mentors giving the workshops. Not many of those workshopologists do have a formal education in pedagogy or in-depth exposure to an educational environment. After discussions at the pikselache festival in Helsinki in 2011, we started a small discussion group on that issue, inviting „workshopologists“ and other practitioners to share their best (and worst) practices, and trying to put forward these meta-level discussion on workshops at various festivals instead of just executing them. During following events labelled as „Workshopology Symposium“ in Maribor, Zurich, Ljubljana and Yogyakarta, we have brought together enthusiastic self-taught workshopologists with science communicators, artists and designers, social activists, art educators and hackers. We believe in the cross-fertilization from these informal educational settings with other pedagogic environments and we have now started a more local network around workshopology, who meets regularly in Switzerland.

I hope to continue with that idea during my time at Aalto University, organizing both local and international gatherings, in Helsinki, as well as in other parts of the world, with the goal to analyze and document more in-depth these practices and share them widely through open online channels.

Journal publications, book chapters and policy papers

Hackteria.org: Nomadic Science and Democratized Labs & Suggested Actions, SEAD: White Papers 2014, Denisa Kera, Marc Dusseiller

The “Hackteria | Open Source Biological Art” initiative started in February 2009 when Andy Gracie, Marc Dusseiller and Yashas Shetty initiated a new model of interdisciplinary cooperation during the “Interactivos 09 Garage Science” workshop at Medialab Prado in Madrid. Instead of using the predominant artist collective model, they intentionally decided to use the hackerspace model of cooperation in interdisciplinary projects. This model is based on the idea of co-working in alternative and independent, temporal spaces rather than building stable structures, such as art laboratories and (new)media centres, or looking for residencies in science laboratories etc. This model also rigorously uses wikis and “work in progress” documents instead of well documented and presented final artworks, which tour various festival and exhibitions. The mode of presentation are workshops involving various people in groups in various parts in the world and sharing know how on what works and what does not work.

Home Made Bio Electronic Arts „Do-it-yourself: Microscopes, Sensors, Sonifications“, Dominik Landwehr, Verena Kuni (Ed.) 2013, Chapter 1 and Interview, M. Dusseiller

“Science for all” is the motto of a new movement which deals with biology and electronics. It applies the do-it-yourself approach, well established in the electronic and computer scene, to natural sciences. Here the boundaries between the arts and sciences are fluid. The artists and scientists who work together in an interdisciplinary manner call themselves “bio-hackers” or “bio-punks” and deliberately continue in the creative tradition of those two movements. Home Made Bio Electronic Arts introduces leading exponents and presents six easy do-it-yourself experimental projects.

- Six easy do-it-yourself experimental projects
- For biotechnology and electronics do-it-yourself enthusiasts

Microfabricated Three-Dimensional Environments for Single Cell Studies, Perspectives paper, Biointerphases, 1, 2006, Dusseiller, Marc, Michael Smith, Viola Vogel, and Marcus Textor

Finally, arrays of engineered 3D cell substrates have significant potential to probe in high-throughput screens the relationship between drug efficacy and the physical and biochemical parameters of given cell environments, thereby improving their predictive power. This approach allows for detection of anomalous points of outliers, within a single population, information which would be missed when only comparing population averages between groups. These future directions highlight our current approach to engineer environments for single cells or aggregates, where aspects including materials properties, interface functionalization, and spatial organization should be considered Fig. 4. Progress will heavily depend on collaborative efforts and open communication between material scientists, to develop smart functional materials serving as sensing and actuating elements, biomedical engineers and molecular biologists, to provide engineered proteins and cells, computer scientists, to expedite analysis of rapidly growing data sets, and engineers, to finally integrate the

Comment

During the years between 2006 and today, I have intentionally worked outside of the academic world of publication, on the streets, in the jungles and in schools worldwide. I see the value of my work through my public and open-access actions and online publications, not closed-access academic writings. Priority has its impact and the sustainability of a growing network. Nevertheless my contributions to the activities in the hackteria framework, science communication and other educational projects, have given rise to a large amount of public attention, traditional print press, interviews, video documentations, book chapters have been written about our work and it has been analyzed academically by a wide array of researchers. My role as a public figure is thus more in creating real world examples, influencing policy makers and talking to a wide public audience. A large selection of those publications can be found in the attachment about my achievements. Below is a short summary of publications in academic journals, which I was authoring myself and/or in collaboration with my co-authors. Most of them go back to my time as a research in the field of bionanotechnology during and after my PhD at ETH Zürich, 2001 – 2006.

Publication list, M. Dusseiller

Achievements where Dr. M. Dusseiller was involved as collaboration partner

Relevant Initiatives

Swiss Mechatronic Art Society - Schweizerische Gesellschaft für Mechatronische Kunst, SGMK (Reg. Society with seat in Zürich)

The Swiss Mechatronic Art Society (SGMK, established in 2006) is a collective of engineers, hackers, scientists and artists that joined to collaborate and promote on creative and critical uses of technology. They develop DIY technologies, collaborate with social and educational institutions, run the diy* festival and the public „MechArt Lab“ in Zurich, and organize workshops in electronics, robotics, physical computing, diy-biology, lofi-music. SGMK has been supported by Bundesamt für Kultur, Migros Kulturprozent, Stadt Zürich and more.

Hackteria | Open Source Biological Art

(international network and webplatform, Reg. Society with seat in Zürich)

Hackteria is a webplatform and collection of Open Source Biological Art Projects instigated in February 2009 by Andy Gracie, Marc Dusseiller and Yashas Shetty, after collaboration during the Interactivos?09 Garage Science at Medialab Prado in Madrid. The aim of the project is to develop a rich wiki-based web resource for people interested in or developing projects that involve bioart, open source software/hardware, DIY biology, art/science collaborations and electronic experimentation. As a community platform hackteria tries to encourage the collaboration of scientists, hackers and artists to combine their expertise, write critical and theoretical reflections, share simple instructions to work with lifescience technologies, develop open source hardware for generic laboratory infrastructure and cooperate on the organization of workshops, temporary labs, hack-sprints and meetings. The hackteria project has been supported by: Sir Ratan Tata Trust, KulturRaum SH, Pro Helvetia, Migros Kulturprozent and more.

BioTehna | open platform for interdisciplinary and artistic research on life sciences, Ljubljana, Slovenia

BioTehna is an open platform for interdisciplinary and artistic research on life sciences and a series of public workshops, each mentored by expert/s in a specific scientific field. The BioTehna Lab is an open community bio-lab, where we ignite curiosity, experiment and explore interesting connections between nature and technology. Here, artists and scientists creatively combine living systems with innovative engineering solutions and in this way encourage reflection and awareness of the world in which we live in and how we think about the future. The initiative started as a collaboration of hackteria | Open Source Biological Art and Kapelica Gallery. The BioTehna platform has been supported through the KiICS project by the European Commission / 7th Framework Programme and the Swiss Contribution to the enlarged European Union.

Achievements - Projects

HackteriaLab 2014 - Yogyakarta

Within the framework of "Hackteria | Open Source Biological Art", the HackteriaLab immersive format plays a key role in experimentation and the development of new models for knowledge sharing and collaboration building, in the emerging artistic practices related to bio- and nanotechnology and science in general.

HackteriaLab, our version of a production workshop, is a form of cultural intervention, contributing to the development of our contemporary culture and art milieu. It creates a melting pot of the practices of art and science, of culture and environment. It aims to broaden the intercultural knowledge exchange and realizes this know-how through workshops, participatory prototype exhibitions and online wiki-like documentations.

DIY biolabs and Open Source Laboratory Infrastructure

If you don't build your lab you don't own your lab. Hackteria is dedicated to develop and promote open designs for affordable laboratory equipment. We are convinced that basic technology should be open and accessible to everyone. We are part of the growing open hardware community and collaborate in various projects.

How to build the essential tools you need in a DIYBio lab? Out of many workshops and open labs sessions grew a set of generic lab equipment that are easy to build and fun to use. Many iteration in the design process were needed to make the construction simple and robust. All devices are built from standard and widely-available components and documented open source.

Workshops

Hackteria has conducted workshops on eg. DIY biology, BioArt, Synthetic Biology, Microscopy, Fermentation and BioElectronix in Europe (Switzerland, Slovenia, Norway, Austria, Hungary, Serbia, United Kingdom, Croatia Germany) , Asia (India, Indonesia, Taiwan, Hong Kong), Africa (Kenya), South America (Colombia, Brazil) and North America (US, Canada).

Temporary Public Labs

The NanoŠmano Labs initiated in 2010 by Stefan Doeppner and Marc Dusseiller in collaboration with Kapelica Gallery (Ljubljana, Slovenia) offer a unique model but also setting and perspective on the use of nanotechnology in interdisciplinary science, art and design projects. In these temporary, ad hoc labs artists, hackers, scientists, and the lay public meet to perform rather than simply witness nanotechnological protocols. They collectively tinker and experiment outside the professional laboratory, in a gallery (2010), in a abandoned bar (2011) or in a community garden (2012), where they manage to ignore the typical function of a gallery setting, and define a new, liminal space of interactions and exchanges across disciplines, scales and practices.

Professor Helena Sederholm
School of Arts, Design and Architecture
Aalto University
FI - Helsinki

Bangalore, 4.14.2015

Postdoctoral Researcher in Art & Science Education, Department of Art, Aalto University

To whom it may concern,

While sitting here with my project partners from the (Art)ScienceBLR Lab, in Sristhi School for Art, Design and Technology, in India, having deep discussions about avantgarde education at the art&science interface in a low-resource context, working with students on developing and designing learning experiences, but also reflecting on how, where and what to do with my life... an email comes in through the vast network of my online contacts „Aalto University: call for post doc“. I wasn't taking much notice. And next day another one „post doc / biofilia“ and then another one „Did you see this? You should apply!“ and „An Open call is open now. Are you going to apply for it?“...

Reading your call, I do have to say, that I never before saw a description that so uniquely fits my core interests, builds upon my experience and fits my future career development plans. Additionally I do think that I can very constructively contribute to the ongoing activities at Aalto University around Biofilia and the art & science education. I am very much looking forward to an interview to look into more detail on how we can structure and develop an interesting research program as well as organize international meetings, combining institutional and academic players with more informal and grass-roots educationists from the DIY, biohacker and citizen science communities I have been involved over the last 8 years.

Within my activies in the **Hackteria framework**, we have been investigating a radically transdisiplinary approach to public engagement with the lifescience, developed workshops on bioart and DIY biology, maintained one of the most substantial online resource about these topics on the hackteria/wiki and established a large network of enthusiastic educators, hackers, engineers and artists, who has been collaborating on the organization of events, such as the HackteriaLabs and the Workshopology Symposia.

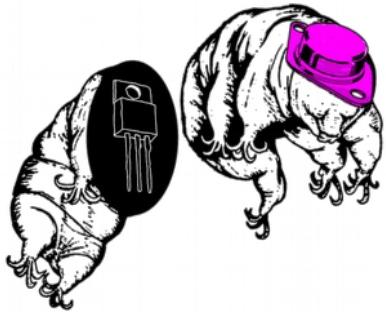

I already had the opportunity for a short term engagement with Aalto University, when I did a 4-day workshop in coordination with LUMO and biofilia in December 2013, „**NanoHacking: Converging Life and Tech at the Nanoscale**“. I am looking forward to learn more about the pioneering educational system of Finland, known for it's unique implementations of contemporary pedagogic thought on a national level and according to the media, in doing so, becoming the most advanced and successful learning environment in Europe.

Yours sincerely,

A handwritten signature in blue ink, appearing to read "Marc Dusseiller".

Dazed & Confused: BIOART NOW: August 2013, S. Fortune

<http://www.dazedsdigital.com/artsandculture/article/16465/1/bioart-now-%E2%80%93-part-1>

.... On the global stage biohacking collective Hackteria has lead the way on demystifying bioart and providing people with easy practical ways to engage with it. Formed in 2009 and featuring chapters in Europe, India and Indonesia the Hackteria Wikipedia has become the de-facto resource for all budding biohackers. The interplay between biohacking and bioart is particularly fluid among Hackteria affiliated practitioners. "Hackteria is not, generally speaking, about finished products or finished works. The bioart just happens, but is not the primary goal" said Hackteria co-founder Marc Dusseiller. Some of that 'incidental bioart' has been quite sublime."

....The Hackteria flavour of bioart and biotech education is particularly visible in Indonesia, where sister organisation Lifepatch complements the bioart residencies hosted by media-art lab the House of Natural Fiber (HONF), helping underfunded school students with such ingenious hacks as converting a webcam into a functioning microscope. At HONF in 2010, Julian Abraham and others initiated a project aimed at creating a safe form of fermentation based on tropical fruit, after the Indonesian government raised prohibitively high duties on alcohol. After leaving HONF, Abraham continued the theme, creating sound-based bioart pieces under the name Kapitän Biopunk. He provided workshops in homebrewing alcohol to accompany his Fermentation Madness, a sound-art piece that converts the processes of fermentation into an interactive soundscape. -....“

Zu Besuch bei den Biohackern , Schweiz am Sonntag, Nr. 18, 5. Mai 2013 , R. Schuppisser

„... Bakterien kultivieren und mit Gentechnik experimentieren: Das geht auch im Heimlabor, nennt sich Amateur-Biologen bauen selber Laborinstrumente und träumen von leuchtenden Pflanzen. Einige auch vom grossen Geld.“

DER ERSTE VERSUCH des Experiments ist fehlgeschlagen. Marc, Tuuli und Urs hatten verschiedene Fische gekauft, in Salzwasser eingelegt und einige Tage liegen gelassen. Nun sollten sich eigentlich die biolumineszierenden Bakterien auf dem Fisch vermehren, sodass man ihr Leuchten im Dunkeln erkennt. Die Bakterien sollten dann in einer Nährlösung aus Salzwasser, Pepton und Agar kultivieren. Doch nun muss erst einmal neuer Fisch her. Experimentieren im Heimlabor braucht Geduld. Marc, Urs und Tuuli sind Biohacker und damit Teil einer Bewegung, die die Welt ähnlich verändern könnte, wie in den 70er-Jahren die Computer-Tüftler mit der Entwicklung des PC in der Garage. Das zumindest glauben euphorische Journalisten und Technik-enthusiastische Wissenschaftler. So meinte etwa der Physiker und Freidenker Freeman Dyson 2007 in einem Essay, «dass die domestizierte mindestens so stark prägen werde, wie die Domestizierung des Co

Ich will, dass Wissen und Technik der ganzen Welt zugänglich ist.»

SENI PAMERAN

Para seniman Yogyakarta berkolaborasi dengan sejumlah peneliti berbasis laboratorium menghasilkan karya tak lazim

SUASANA Galeri 2, Langgeng Art Foundation (LAF), Jalan Suryodiningrat 37, Yogyakarta, petang itu sudah mirip kapal pecah. Ember plastik, meja bambu, botol dan tabung-tabung ramping, sampai akuarium berbaur dengan jalur-jalur kabel, layar televisi LCD, dan laptop di mana-mana. Di lantai, ada silang-silang jalur yang meruapkan bau tanah, menghubungkan penonton dengan centang-perenang obyek dan pelaku eksperimen. Sejumlah peserta pameran sibuk mengutak-atik karya. Inilah pameran "#HLab 14 (HackteriaLab 2014)", proyek kerja sama antara para peretas, ilmuwan, peneliti, dan seniman, yang berlangsung sejak 25 April sampai 2 Mei ini.

[1]

jakan sejumlah komunitas dan lembaga. Reklame tanah pertanian pasca-lenturan Gunung Merapi akhirnya dibuat oleh Laboratorium Mikroskopik Fakultas Biologi Universitas Gadjah Mada, pengawas sungai dan kandungan bakteri E. coli oleh komunitas Lifepatch (Yogyakarta), serta upaya pelestari keberagaman hayati di Hutan Wonoadi oleh kelompok Green Tech. Apa yang kita temukan di pameran ini?

Die Forscherpiraten kommen ins Museum, Schaffhauser Nachrichten, 11. June 2014, Saskia Baumgartner

Bei Hackteria vermischt sich Biologie mit Kunst. Am nächsten Wochenende geben beteiligte Forscher und Kreative im Museum zu Allerheiligen einen Einblick darin.

Interdisziplinärer Ansatz

Aber was wollen die Hackteria-Organisatoren nun erreichen – ein modernes Biologie-Projekt schaffen oder Kunst machen? «Wir wollen erst einmal, dass Menschen aufhören, in solchen Boxen zu denken», sagt Dusseiller. «Wir machen nicht nur Kunst, und wir machen nicht nur Wissenschaft, wir wollen Grenzen aufbrechen.» Interdisziplinarität ist das Stichwort.

Lokale Themen

Gerne werden zu den Veranstaltungen auch lokale Künstler und Wissenschaftler geladen, und man setzt sich mit den Themen vor Ort auseinander. Beim HackteriaLab in Indonesien etwa waren die dortige Wasserverschmutzung und der Vulkanismus Thema – in der Nähe Yogyakartas gibt es mehrere aktive Vulkane, erst im Februar hat wieder eine Aschewolke die Stadt überzogen. Zumindest der Randen wird bei der Hackteria-Veranstaltung in Schaffhausen auch Thema sein. Dieser soll bei einem Klangspaziergang – einer akustischen Entdeckungsreise – erkundet werden.

Die Forscherpiraten kommen ins Museum

Bei Hackteria vermischt sich Biologie mit Kunst. Am nächsten Wochenende geben beteiligte Forscher und Kreative im Museum zu Allerheiligen einen Einblick darin.

VON SASKIA BAUMGARTNER

Wenige Monate mit acht Biologen schwimmen auf dem Computerbildschirm hin und her. Die Bilder dieser Biologen sind jedoch keine abstrakte Wirkung, welche zuvor mit wenigen Tastendrücken erzeugt wurde, sondern wurde. Mit einem Alltagsgegenstand wurde an dem kontingenziellen Laborprojekt des internationalen Hackteria-Labs gearbeitet. Dieses Mikroskopie-Experiment ist typisch für das Hackteria-Prinzip: Motivation, was die beteiligten Kinder und Wissenschaftler – etwas vereinfacht gesagt – im Sinn haben, ist die Technologien die Welt der Bakterien

So funktioniert Hackteria: Musiker Pei-Wen Liu und Hackteria-Mitbegründer Marc Dusseiller mit einem Koffer voller Experimente, die als Alltagsgegenstände entwickelt wurden.

Programm Hackteria im Museum zu Allerheiligen

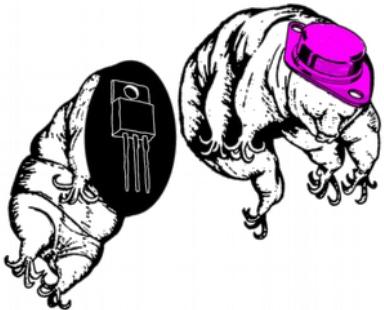

Donnerstag, 12. Juni Von 10 bis 14 Uhr: Der zweite Hackteria-Workshop des Museums zu Allerheiligen statt. Bei dem ein Workshop für Kinder und Jugendliche und AnfängerInnen sind erwünscht. Montag, 16. Juni: Der zweite Hackteria-Workshop über Biokunst, Biogenomik und Transgenetik, mit Gästen aus Frankreich, Indonesien und der Schweiz. Donnerstag, 19. Juni: Von 10 bis 11.30 Uhr Klangspaziergang auf dem Randen, der durch die Stadt begrenzt, wird Hackteria sich – wie auch der Umsatz selbst – dazu verwenden, die Akustik des Naturtheaters Pei-Wen Liu am Zürichberg zu erkunden. Samstag, 21. Juni: Hackteria eigentlich jeder. Dusseiller organisiert Regionen, um verschiedene für Schule, beim Workshop am letzten Donnerstag etwa werden auch Kindergartenkinder eingeladen.

Lokale Themen

Gern werden zu den Veranstaltungen auch lokale Künstler und Wissenschaftler eingeladen und man setzt sich mit den Themen vor Ort auseinander. Beim HackteriaLab in Indonesien etwa waren die dortige Wasserverschmutzung und der Vulkanismus Thema – in der Nähe Yogyakartas gibt es mehrere aktive Vulkane, erst im Februar hat wieder eine Aschewolke die Stadt überzogen. Zumindest der Randen wird bei der Hackteria-Veranstaltung in Schaffhausen auch Thema sein. Dieser soll bei einem Klangspaziergang – einer akustischen Entdeckungsreise – erkundet werden.

Beim Workshop am 12. Juni bauen die Teilnehmer mit ein paar Handgriffen eine Einstellung zum Mikroskop um.

„SENI GOTONG ROYONG, HackteriaLab 2014 – Yogyakarta“ Documentary Film by X-Code films

<http://hackteria.org/wiki/HLab14-Documentary>

Citizen science has long contributed to the health of local communities by making people aware of their environment in the form of oral histories and traditional wisdom. Recently, the effort to democratize science created opportunities for innovation and a model for public participation in science. These movements rippled into many things such as a kind of revival of traditional knowledge, influential policy forces, changes in how we produce and share knowledge into an iterative and collective process. Yogyakarta, Indonesia, has been one of the most active hubs in this movement.

HackteriaLab 2014 – Yogyakarta is a two-weeks making-oriented gathering of researchers, artists, scientists, academicians, hackers and whatevers in Yogyakarta. It was hosted by LIFEATCH - citizen initiative in art, science and technology and co-organized together with HACKTERIA | Open Source Biological Art in collaboration with various regional partners. As a web and community platform, Hackteria tries to encourage scientists, hackers and artists to collaborate and combine their expertise, write critical and theoretical reflections, share simple instructions to work with life science technologies and cooperate on the organization of workshops, festival and meetings.

Produced and directed by X-Code films, this documentary was made during the two weeks of HackteriaLab 2014 – Yogyakarta. It offers you a glimpse of (almost) everything that happens and documents the participants wish list for future collaborations and works.

The Art of Open and Free Science, MCD #68, 2012, Ed. A. Delfanti, Interview S. Tocchetti

<http://www.digitalmcd.com/mcd-68-la-culture-libre-the-open/>

Could you explain what is Open Source Biological Art and how it relates to DIY biology?

Whether it is a wiki or a workshop or both doesn't really matter, what is essential is to enable people to collaborate and share knowledge and instructions. Open Source Biological Art enables people to perform complex scientific protocols without the support of an official institution. We believe that it is important to enable more people to feel confident in working with living systems in order for creative and new ideas to emerge. When applied to science and art, it can create a new type of public participation and understanding of both domains.

What is your view on the future of citizen science?

My hope is that if more people are making things with their hands and have this direct and everyday experience with scientific protocols, we can demystify science and open the whole decision making process to more people and opinions. I think this is the future society, where I want to live, a place where tinkerers and lay people find new and unexpected uses and functions of technologies and scientific knowledge, where they hack it and adapt it to their dreams and lives and don't wait for some big corporation or government to decide what is good or safe for them.

Der Aufstand der Bastler, November 2012, ABSTRAKT N°8 "Machen ist Macht", Max Celko

<http://hackteria.org/?p=1870>

In Garagenlaboren macht sich analog zu den Computernerds der späten Siebzigerjahre eine junge Generation von Amateurbiologen ans Werk: die Biohacker. Marc Dusseiller ist Gründer des Hacker-Netzwerks Hackteria. Dass in der Szene der Bill Gates der Do-it-yourself-Forschung zu finden ist, glaubt er aber trotzdem nicht.

... Worin liegt denn der gesellschaftliche Mehrwert des Selberforschens?

Ein zentraler gesellschaftlicher Nutzen ist es, dass die DIYBioszene auch Laien den Zugang zur wissenschaftlichen Diskussion ermöglicht. Damit wird die Biotechnologie zumindest ein Stück weit demokratisiert. Ich halte dies für sehr wichtig, denn wir stehen heute an einem Punkt, an dem die Biotechnologie rasante Fortschritte macht und völlig neue Möglichkeiten eröffnet, lebende Materie zu manipulieren. Es liegt jetzt an uns allen, gemeinsam als Gesellschaft zu definieren, welche Forschung wir möchten und welche gesetzlichen Schranken wir der Biotechnologie auferlegen. Als Folge des größeren Wissens sind die Leute auch weniger anfällig für populistische Ideen von Politikern oder leere Marketingversprechen von Firmen.

Gott im Hobbyraum, NZZ am Sonntag, 19. Okt 2014, Dominik Imseng

«Es geht darum, einen Blick hinter den Vorhang zu werfen, an der Zukunft teilzuhaben, eine transformative Erfahrung zu machen», sagt der studierte Mikrotechniker, der ein Bio-Labor in Koffergröße entwickelt hat, das sich überallhin mitnehmen lässt. Wer sich mit Gaudenz unterhält, führt ein rasch hochphilosophisches Gespräch entlang den Schnittstellen Mensch/Technik, Code/Zelle, Bit/Atom und nicht zuletzt Wissenschaft/Kunst. So gehört denn auch das Schweizer Künstlerduo Heidy Baggenstos und Andreas Rudolf, das leuchtende Pilze und Bakterien züchtet, zu Gaudenz' Biohacker-Freundeskreis. «Gerade solche Bio-Art-Projekte zeigen, wie breit die Biohacker-Bewegung ist», sagt Gaudenz. «Technologieaktivismus, Bürgerwissenschaft, Kunst – alles ist Biohacking. Permanent gärt und brodelt es in der Szene. Man trifft sich irgendwo, packt sein Zeug aus, experimentiert. So entsteht ein befriedender Dialog.

ART & SCIENCE THE OPEN FUTURE/FREE CULTURE

INTERVIEW WITH MARC DUSSEILLER

HACKTERIA

■ Could you tell me something about the history of Hackteria and how it is changing over the years?
The first meeting in Madrid during a large workshop organized by the Medialab Prado called 'Interaction09: Garage Science', on how the open source and citizen science approach can be used to help us to do our own bio-experiments. As a DIYbio geek from Germany, Rüdiger Tropf, who will move to Copenhagen soon to start organizing workshops there, was invited to speak. In the workshop we decided that we need a type of organization and activities that will bridge the gap between the biohacker culture and the more emergent DIYbiology science approach, and Yasha came up with this funny name Hackteria. We organized our first Hackteria workshop in his garage in Berlin and it was a success. sound interfaces. In 2010 Hackteria started a series of expert gatherings during which we evaluate what was done and established new collaborations. Right now we have 135+ sites in Lucerne working closely with SGMK on new workshops on laboratory infrastructure, then Brian Degger, who co-founded a Hackteria chapter in Switzerland, helped us to understand how these future techniques will interact and influence our everyday life impractical in very different contexts. Most Hackteria chapters are now in Europe, but we are also interested, we like to impose in new locations and with new people, which often results in unexpected and innovative projects. Data sharing, tool and experiments with technologies in the DIY manner on the streets, in the art centers or various other locations helps us understand how to create tools and processes that will simply enable more people to enjoy research and tinker around with 'expert' knowledge.

Innovation regimes based on collaborative and global tinkering: Synthetic biology and nanotechnology in the hackerspaces, *Technology in Society*, October 2013, Denisa Kera

<http://www.sciencedirect.com/science/article/pii/S0160791X13000638>

Typically nanotechnology and synthetic biology are discussed in terms of novel life forms and materials created in laboratories, or by novel convergences of technologies (ICTs and biological protocols) and science paradigms (engineering and biology) they initiated. Equally inspiring is their ability to generate novel institutions and global communities around emergent sciences, which radicalize the forms of public engagement and ethical deliberation. We are starting to witness alternative (iGEM competitions) and almost underground R&D engagements with Synthetic Biology (DIYbio movement), which inspired the emerging bottom-up involvements in nanotechnologies in projects, such as the NanoSmanoLab in Slovenia. These bottom-up involvements use tinkering and design as models for both research and public engagement. They democratize science and initiate a type of grassroots "science diplomacy", supporting research in developing countries. We will discuss several recent examples, which demonstrate these novel networks ("Gene gun" project by Rüdiger Trojok from the Copenhagen based hackerspace, Labitat.dk, the "Bioluminescence Project" by Patrik D'haeseleer from Biocurious biotech hackerspace in Sunnyvale, CA, and the "Biodesign for the real world" project by members of the Hackteria.org). They all use design prototypes to enable collaborative and global tinkering, in which science and community are brought together in open biology laboratories and DIYbio hackerspaces, such as Hackteria.org or Biocurious. In these projects research protocols encompass broader innovative, social and ethical norms. Hackerspaces represent a unique opportunity for a more inclusive, experimental, and participatory policy that supports both public and global involvements in emergent scientific fields.

Hackteria: An example of neomodern activism. Leonardo Electronic Almanac, Vol 20.1, 2014, Boris Magrini

<http://ojs.gold.ac.uk/index.php/lea/article/view/11>

As a platform for knowledge sharing and artistic exploration, Hackteria constitutes a network of artists and researchers that merge the use of biotechnologies with hacking and do-it-yourself strategies. Its process-oriented and performative approaches, opposing to the materialistic imperatives of the art market, lean to the tradition of political art. In the present paper, I am arguing that Hackteria embodies what could be considered a neomodern activism, other recent examples of which are emerging within the new media art field. Instead of rejecting new controversial technologies, they propose a vision of a society that is moved forward by a more democratic use and discussion of these technologies. The activities of Hackteria are examined through the presentation of a bio-lab created in Ljubljana.

ARTICLE

Abstract

As a platform for knowledge sharing and artistic exploration, Hackteria constitutes a network of artists and researchers that merge the use of biotechnologies with hacking and do-it-yourself strategies. Its process-oriented and performative approaches, which oppose the materialistic imperatives of the art market, follow the tradition of political art. In this paper, I argue that Hackteria embodies what could be considered as a neomodern activism, other recent examples of which are emerging within the new media art field. Instead of rejecting controversial new technologies, they propose a vision of a society that is propelled by a more democratic use and discussion of these technologies. The activities of Hackteria are examined through the presentation of a bio-lab created in Ljubljana.

Light blue at Hackteria stakes exactly the opposition of performance art and the aesthetic of the new media art. It is a performative art that is based on the opportunity to interact with the audience, to share knowledge and to merge the two. Hackteria is a network of artists and researchers that merge the use of biotechnologies with hacking and do-it-yourself strategies. Their activities of the art market, follow the tradition of political art. In this paper, I argue that Hackteria embodies what could be considered as a neomodern activism, other recent examples of which are emerging within the new media art field. Instead of rejecting controversial new technologies, they propose a vision of a society that is propelled by a more democratic use and discussion of these technologies. The activities of Hackteria are examined through the presentation of a bio-lab created in Ljubljana.

The roots of Hackteria: from performative art to tactical media.

The events organized by Hackteria are rooted in a long tradition of media art, as well as process-oriented and performative approaches. Performative art is not equivalent to process-oriented art; as Andreas Broeckmann correctly pointed out, "it only makes sense to speak of process-orientation in cases where the evolving process itself is a main factor of the aesthetic experience of the work." [4] Nonetheless, neither performative nor process-oriented art focus on the creation of a finite product, a distinctive trait of the activities run by Hackteria. Furthermore, the BioTehna project, for example, share both performative, interactive and process-oriented qualities, for it is not the lab as such that is meaningful to the artistic intent of the group but rather the process involved in building and running it.
